

Stage IV Cancer Clinical Report (Sample for Testing)

This is a fictional sample report created for software testing and demonstration purposes only.

Patient Information

Patient ID: P10045

Age: 68 Years

Gender: Male

Chief Complaint

Persistent cough, severe weight loss, chest pain, fatigue, and shortness of breath.

Medical History

Hypertension, Type 2 Diabetes Mellitus, Former Smoker (40 pack-years).

Clinical Findings

Diagnosis: Stage IV Non-Small Cell Lung Cancer (NSCLC). Primary tumor identified in the right lung with metastatic spread to the liver, bones, and brain. Tumor size measured approximately 6.8 cm with mediastinal lymph node involvement.

Symptoms Observed

Chronic cough, fatigue, chest pain, hemoptysis, dyspnea, and significant weight loss.

Laboratory Results

Hemoglobin: 9.2 g/dL

White Blood Cells: $14.5 \times 10^9/L$

Platelets: $420 \times 10^9/L$

CEA: 95 ng/mL

Imaging Results

CT Scan: Large right upper lobe mass with mediastinal lymphadenopathy.

PET Scan: Multiple hypermetabolic lesions in liver and vertebrae.

MRI Brain: Two metastatic lesions in the left frontal lobe.

Treatment Plan

Chemotherapy: Carboplatin, Pemetrexed

Immunotherapy: Pembrolizumab

Radiation Therapy: Palliative brain radiation

Pain Management: Morphine, Gabapentin

Risk Assessment

Risk Level: High (95/100). Advanced metastatic disease involving multiple organs.

Prognosis

Poor. Close oncology follow-up recommended every two weeks.
